1 BD21 Assessment

This report presents the BD21 assessment for structure WHE/17.

1.1 Location of Structure

Structure WHE/17 carries the B158 (Port Hill Rd, Hertford) over the disused railway line from Welwyn Garden City to Hertford. The structure is located near the centre of Hertford at OS ref. TL 323129.

1.2 Construction Type

Reconstructed in 1954, the single span overbridge comprises eighteen precast pre-stressed high alumina concrete internal beams and two cast iron edge girders, with brick abutments and wingwalls. The parapets are constructed from brickwork with brick copings. The bridge prior to 1954 was a 5-span bridge, having 2-double arches adjoining the middle section consisting of 5 cast iron girders and jack arches. According to historic drawings, the arches have been partly demolished and infilled. The arch faces have been closed by brick retaining walls.

The structure has a square span of 6.63m (distance between the abutments). Road width is approximately 5.05m and both verges are approximately 1.35m wide.

1.3 Information used to form the Assessment

Section sizes used to calculate dead loads were obtained from site measurements. (See Jacobs report "05/06 BE4 Assessment Programme – Assessment and Inspection Report – Structure WHE/17 August 2005") and archive data including drawings.

Assessment live loading were obtained from and applied in accordance with BD21/01, assuming "Medium" HGV flow and "Poor" road condition. "Poor" road condition was selected on account of undulations and cracking of the road surface.

Road surface condition at bridge

1.4 Methodology

The load effects from BD21 UDL and KEL loading on the deck were analysed by simple dispersion at 45° of the 2.5m wide lane loading strips into the deck. It is noted that there is little transverse reinforcement in the deck therefore capacity for lateral distribution will be limited. Accidental vehicle loading on the footways was also be analysed initially by simple dispersal.

The beams were analysed making an allowance for conversion of the high alumina concrete. Testing of the in-situ concrete has indicated a degree of conversion of 83% and compressive strength of about 17 N/mm^2, which compares with 5000 lbs/in^2 (34.5 N/mm^2) specified on the drawing as a 48 hour strength. With this degree of conversion the concrete might be considered to be close to its residual strength. It was not possible to take cores from the pre-stressed beams. It was assumed that conversion and loss of strength in the beams is similar to the in-situ concrete. Initial specified strength at 72 hours was 7500 lbs/in^2 (51.7 N/mm^2); therefore a residual strength of 25 N/mm^2 was used in assessment.

Stressing wire properties are shown on the drawing, namely 105 $tons/in^2$ UTS, 80 $tons/in^2$ 0.1% proof stress. Characteristic strength of the wire was taken as 90% of UTS, i.e. 1470 N/mm^2.

In calculating the shear capacity of the pre-stressed beams it was assumed that the pre-stressing force related to 50% of the UTS of the wires.

The in-situ concrete was considered as acting compositely with the beams as ample binders (links) have been provided.

The cast iron edge girders will be checked for dead loads and accidental vehicle effects, using the permissible stresses in BD21/01.

1.5 Results of BD21 Assessment

Element: **Concrete beams below carriageway**

Span = 6.75m

26 tonne loading K factors for various road surface and HGV flow combinations:

	HGV Flow		
Road Surface	High (H)	Med. (M)	Low (L)
Good (g)	0.79	0.77	0.75
Poor (p)	0.89	**0.87**	0.85

18 tonne loading K factors for various road surface and HGV flow combinations:

	HGV Flow		
Road Surface	High (H)	Med. (M)	Low (L)
Good (g)	0.63	0.60	0.57
Poor (p)	0.70	**0.68**	0.65

Group 1FE : K factor for all conditions is **0.50**

C = Available live load capacity / Live load capacity required for Adjusted HA loading and relates directly to the K factors in Figures 5.2 to 5.7 of BD21/01.

Action	Location	Dead load effect	HA adjusted LL effect	Assessed live load resistance	C factor	Live load rating
Bending	Mid-span	47.3 kN.m	139.2 kN.m	119.9 kN.m	0.86	18 tonnes
Shear	Support	28.0 kN	82.5 kN.m	43.67 kN	0.53	**7.5 tonne Group 1 FE**

Element: **Cast iron edge girders (Accidental Vehicle Loading)**

Checked for accidental vehicle loading in accordance with Annex D of BD21/01.

Capacity factor = Available live load capacity / assessed live load effects (selected accidental vehicle)

Vehicle gross weight (tonnes)	**Axle weights W (tonnes) and spacings A (m)**								
Full Assessment Live Loading	W1	A1	W2	A2	W3	A3	W4	A4	W5
44[6]	**7.0**	2.8	**11.5**	1.3	**7.5**	7.6	9.0	1.35	9.0
40[5]	5.0	2.8	10.5	1.3	4.5	4.8	10.0	1.8	10.0
26 tonne RC	**7.0**	3.42	**11.5**	1.3	**7.5**				
18 tonne RE	**6.5**	3.0	**11.5**						
7.5 tonne RF	**1.5**	2.0	**6.0**						

Single 11.5 tonne axle is critical load on span; therefore 44, 40, 26 and 18 tonne vehicles have same effect.

Action	Location	Dead load effect	Accidental vehicle loading	Assessed live load resistance	Capacity factor	Live load capacity
Bending 40/44T AVL	Mid-span	129.3 kN.m	67.9 kN.m	84.3 kN.m	1.24	40/44t AVL
Shear 40T AVL	Support	74.8 kN	40.0 kN	348 kN	8.7	40t AVL

Element: **Substructure**

The supports show no signs of structural distress. By qualitative assessment, they appear to be satisfactory for current loading.

1.6 Load Rating

Based on the assessment assumptions, the pre-stressed concrete beams are marginally deficient in bending for 40 tonne loading. With "good" road surface conditions the beams would pass for 40 tonnes, but there are distinct undulations in the road which indicates the capacity should be based on a "poor" rating.

The shear capacity of the bridge presents some problems in the BD21/BD44 assessment. The permissible shear stress in BD44 is considerably lower than that given in CP116; 0.29 N/mm^2 as opposed to 0.413 N/mm^2 (60 lbs/in^2). The formulae in BD44 clause 7.4.2.2 for combined shear capacity between the beams and infill concrete give a lower value in this case than on the beam alone. The shear capacity of the beam alone is also restricted as the web width is only 51mm (2 inches) and single links only 8mm diameter. The shear capacity of the beams corresponds to 7.5 tonnes and Group 1 Fire Engines. Improving the road surface condition would not help the rating in this instance.

There is also residual doubt about the concrete compressive strength of the high alumina cement beams. Extracting cores for testing has never been attempted because the beams are stressed and relatively small. The concrete strength has been based on code requirements for high alumina beams with a conversion decrease related to the degree of conversion found by testing in the in-situ concrete.

The cast iron edge girders take only a small proportion of the load from accidental vehicle loading on the footways and appear to be satisfactory for full loading. Although not specifically assessed, it is expected that the concrete beams under the footway will be deficient for accidental vehicle loading as they are the same as under the carriageway.

Prospects for strengthening a deck of this type are limited. Individual beams would have to be propped along their length as the pre-stressing arrangements may not cope with stress reversals imposed by discrete supports. In-filling would be a more economic solution.

FORM 'BA' (BRIDGES)

ELR/ Bridge No WHE/17

CERTIFICATION FOR ASSESSMENT CHECK

Assessment Group: **Jacobs Engineering UK Ltd**

Bridge/Line Name: **B158 Port Hill / Welwyn Garden City to Hertford**

Category of Check: **1**

ELR/ Bridge No: **WHE/17**

We certify that reasonable professional skill and care have been used in the assessment of the above structure with a view to securing that:

(1) It has been assessed in accordance with the Approval in Principle as recorded on Form AA approved on 30 March 2010.

(2) It has been checked for compliance with the following principal British Standards, Codes of Practice, BRB (Residuary) Limited technical notes and Assessment standards:

BD 21/01 - "The Assessment of Highway Bridges and Structures"

BD 44/95 - "The Assessment of Concrete Highway Bridges and Structures"

List any departures from the above and additional methods or criteria adopted, with reference and justification for their acceptance.

None

CERTIFICATION FOR ASSESSMENT CHECK

Notification of Assessment Check

Assessment Group	Jacobs Engineering UK Ltd
Bridge Name/Road No.	Port Hill / B158
Line Name	Welwyn Garden City to Hertford
ELR Code/Structure No.	WHE/17

The above bridge has been assessed and checked in accordance with Standards which are listed on the appended Form BA. A summary of the results of the assessment in terms of capacity and restrictions is as follows:-

STATEMENT OF CAPACITY

Carriageway beams	7.5 tonnes Group 1 FE
Cast iron edge girder	40/44 tonne accidental vehicle
Abutments (qualitative assessment)	Satisfactory for current loading

Recommended Loading Restrictions

7.5 tonnes Group 1 FE

Description of Structural Deficiencies and Recommended Strengthening

The high alumina concrete beams are deficient in shear capacity when assessed to BD44. The provisions for shear in BD44 are more onerous than for permissible stress analysis based on CP116, hence the difference in rating between the BD21 and BE4 (BS153 Pt 3A) assessments.

The beam capacity has been based on estimates of concrete strength and degree of conversion (high alumina cement) based on testing on the infill concrete.

The bridge is otherwise in satisfactory condition. The road surface condition at the time of inspection was rated as "poor". Improving the road condition would not enable the shear rating of the beams to reach the next loading level.

Strengthening is likely to be uneconomical. Infilling would be the preferred option.

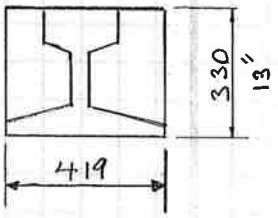
Dead load (Precast centre beam)

Beam + surrounding concrete:

BD 21/01 Table 4.1

Take concrete density = 2400 kg/m³

wt. = 2400 x 0.33 x 0.419 = 331.8 kg/m



Road level at Road centre line (centre beam) = 100.593

∴ concrete overlay depth = (100.593 − 99.973) − 0.33 − 0.1

= 0.19 m

wt. = 2400 x 0.19 x 0.419 = 191.1 kg/m

surfacing density = 2300 kg/m³

wt. = 2300 x 0.1 x 0.419 = 96.4 kg/m

Table 3.1 Total factored dead load = 331.8 x 1.15 x 1.1
+ 191.1 x 1.15 x 1.1
+ 96.4 x 1.75 x 1.1

= 847.03 kg/m = 8.31 kN/m ✓

CALCULATION SHEET

Live load (centre beam):

Raad width = 2 x 2.525m = 5.05 m > 5.0m

BD 21/01 Table 5.1 — No. of national lane = 2

Effective span = 6.75m

5.18 — $HA = 336 \times (\frac{1}{L})^{0.67} = 93.48$ kN/m/lane

5.23 — AF = 3.65/2.5 = 1.46 — $\gamma_m = 1.5$

5.18 — KEL = 120 kN/Lane — $\gamma_{f_3} = 1.1$

Beam width = 0.419m

lane width = 2.5m

∴ Max moment at mid span (live load)

$= \left(93.48 \times 6.75^2/8 + 120 \times 6.75/4 \right) \times \frac{1}{1.46} \times \frac{0.419}{2.5} = 84.36$

BD21/01 Table 3.1 — ∴ Max factored live load moment = 84.36 x 1.5 x 1.1 = 139.2kN.m

Max shear at supports (live load)

$= (93.48 \times 6.75/2 + 120) \times \frac{1}{1.46} \times \frac{0.419}{2.5} = 50$ kN

∴ Max factored live load shear = 50 x 1.5 x 1.1 = 82.5 kN.m

P.5 — ∴ Total Moment (DL+LL) = 47.33 + 139.2 = 186.53 kN.m

P.5 — Total shear (DL+LL) = 28.05 + 82.5 = 110.55 kN

Project Title: BRB(R) Ltd - Major Works Programme 2009-2012			Sheet No: 6
Subject: WHE/17			Calc No: 192.2
Job No: B12360AH			File: R16
Made By: [redacted]	Date: 03/10	Revised By:	Date:
Checked [redacted]	Date: 3/10	Checked By:	Date:

P. 5 Precast beam bending capacity (live load) = 167.2 − 47.33 = 119.87 kN.m

calc 192.1 P. 6 Max applied moment = 139.2 kN.m

$\therefore C = 119.87 / 139.2 = 0.861$

BD21/01 Fig 5.3 K (Medium traffic, Poor road condition) $\begin{cases} 26^t = 0.87 \\ 18^t = 0.68 \end{cases}$

∴ Centre precast beam is adequate for 18^t loading in bending.

Shear capacity:

BD 44/95 6.3.4.2 $V_{co} = 0.67\ b\ h\ \sqrt{(f_t^2 + f_{cp} f_t)}$ (Pre-cast units acting alone)

calc 192.2 P. 1 $b = 2'' = 50.1$ mm (The effect of concrete fill ignored)

$h = 330$

$A_{tendons} = 20.3\ mm^2$

$f_t = 0.32 \sqrt{\frac{f_{cu}}{\gamma_{mc}}} = 0.32 \sqrt{\frac{25}{1.5}} = 1.31\ N/mm^2$

calc 192.1 P. 5 clear span = 6.64 m

Beam length = 27'-0" = 8.230 m

BD 44/95 CL. 6.7.4 Transmission length:

$l_t = k_t \phi / \sqrt{f_{ci}}$

$k_t = 600$

$\phi = 5$ mm

$f_{ci} = 0.75 f_{cu} = 0.75 \times 25 = 18.75\ N/mm^2$

$l_t = 600 \times 5 / \sqrt{18.75} = 693$ mm

CALCULATION SHEET

JACOBS

Project Title: BRB(R) Ltd - Major Works Programme 2009-2012			Sheet No: 7
Subject: WHE/17			Calc No: 192.2
Job No: B12360AH			File: R16
Made By: [redacted]	Date: 03/10	Revised By:	Date:
Checked By:	Date:	Checked By:	Date:

Supported length of beam = $(8.230 - 6.64)/2$

$= 0.795\text{m} > 0.693$ (transmission length)

∴ Capacity can be based on full tendom stress.

Prestressing force will be 70% of ultimate tensile stress, less losses:

Take tendons stress = $1470 \times 50\% = 735\ N/mm^2$

No of tendons = $15+5+2 = 22$

$f_{cp} = (735 \times 22 \times 20.3)/(50967.6) = 6.44\ N/mm^2$

$V_{Co} = 0.67 \times 50.1 \times 330 \times \sqrt{(1.31^2 + 6.44 \times 1.31)} \times 10^{-3}$

$= 35.3\ kN$

Capacity of links:

BS 8110 cl. 6.3.4.4 $V_s = A_{sv}(f_{yv}/\gamma_{ms})\frac{d_t}{s_v}$

$A_{sv} = 2 \times \left(\pi \times (5/16)^2/4\right) \times 25.4^2 = 98.97\ mm^2$

Table 4A $\gamma_m = 1.15$ $s_v = 6''$

P. 1B $d_t = (12'' \times 15 + 11'' \times 5 + 4'' \times 2)/22 = 11.04''$

$V_s = 98.97\ (230/1.15)\ 11.04''/6 \times 10^{-3} = 36.42\ kN$

∴ Total shear capacity = $35.3 + 36.42 = 71.72\ kN$

calc 1921 P.5 live load shear capacity = $71.72 - 28.05 = 43.67\ kN$

Applied live load shear = $82.5\ kN$

∴ $C = 43.67/82.5 = 0.53$

Edge girder :

P.2 $Z_{top} = 5292.16\ cm^3$

$Z_{bat} = 5733.98\ cm^3$

Dead laad stress (bending):

Calc. 192.1 P. 5 $\sigma_t = \frac{M}{Z_{bat}} = \frac{129.3 \times 10^6}{5733.98 \times 10^3} = 22.55$ (tensile)

$\sigma_c = \frac{M}{Z_{top}} = \frac{129.3 \times 10^6}{5292.16 \times 10^3} = 24.43$ (compression)

Dead load stress (shear):

calc 192.1 P1. P.5 Web area at supports = $1\frac{1}{2}" \times 16" \approx 25.4^2 = 15483\ mm^2$

$\sigma = \frac{74.8 \times 10^3}{15483} = 4.83\ N/mm^2$

Dead load effect:

BD 21/81 cl. 4.10 ∴ Total tensile bending stress = $22.55 < 46\ N/mm^2$ ∴ OK

Total compressive " " = $24.43 < 154\ N/mm^2$ OK

Total shear stress = $4.83 < 46\ N/mm^2$ ∴ OK

∴ Edge girders are adequate for dead load.

P.6 Max bending moment = 67.9 kN.m (live load)

P.7 Max live load shear = 40.0 kN

BD 21/01 cl. 4.10

Permissible live load tensile stress:

$f_L = 24.6 - 0.44 f_d = 24.6 - 0.44 \times 22.55 = 14.7 \ N/mm^2$

Assessed live load resistance (tensile)

$= 14.7 \times 5733.98 \times 10^{-3} = 84.3 \ kN.m$

Applied live load moment = 67.9 < 84.3 kN.m

∴ Edge girder is adequate for Accidental Vehicle Loading in tensile bending

Permissible live load stress (compression)

P.1

$f_L = -43.9 + 0.79 f_d = -43.9 + 0.79 \times (-24.43) = -63.2 \ N/mm^2$

$f_L = -81.3 + 3.15 f_d = -81.3 + 3.15 \times (-24.43) = -158.2 \ N/mm^2$

$f_L + f_d < 154$

$\therefore f_L = 154 - 24.43 = 129.6 \ N/mm^2$

∴ Assessed lived load resistance (compression)

$= 129.6 \times 5292.16 \times 10^{-3} = 685.9 \ kN.m > 67.9 \ kN.m$

Edge girders are adequate for Accidental Vehicle loading in comp. bending
